EXPERIMENT:05

NAME: LAL SHIVAAN S L ROLL NO:240701285

Experiment Title: The Frictionless Purchase Funnel

Hypothesis: By providing a consolidated checkout "pop" (modal) rather than a multi-page checkout process, the user will experience lower cognitive load and a higher completion rate.

1. The Variables

Independent Variable: The navigation flow and UI layout (the wireframe design).

Dependent Variable: The "Conversion Rate" (percentage of users who reach the Order Confirmation screen) and "Time-to-Purchase."

Control Factors: Consistent bottom navigation and top header "Delicious" branding to maintain user orientation.

2. Experimental Phases (The User Journey)

Phase A: Identity Verification (Registration/Login)

The experiment begins by establishing a user profile. The layout tests whether a minimalist "User Name/Password" field set reduces the "bounce rate" during the high-friction entry point.

Phase B: Information Architecture (Home & Product Description)

The user enters the "Discovery Phase."

Home Page: Uses a grid system to test visual scanning patterns.

> Product Description: Tests the effectiveness of "Social Proof" indicators (Heart/Favorite icons and Share icons) in influencing the user's decision to add an item to the cart.

Phase C: The Micro-Conversion (My Cart)

The user interacts with a Quantity Adjuster. This is a functional test to see if users find the increment/decrement symbols intuitive for managing their budget before the final commitment.

Phase D: The Critical Transition (The "Pop")

The screen labeled "pop" is the core of the experiment. Instead of a new page, it uses an overlay (modal) for delivery and payment details.

> Purpose: To test if keeping the background context (the cart) visible reduces "User Anxiety" during payment.

Phase E: Post-Action Feedback (Order Confirmation)

The experiment concludes with a Success Message and a 5-star rating scale. This measures the "Peak-End Rule"—the psychological theory that people judge an experience largely based on how they felt at its peak and its end.

---

3. Data Collection Points

During this experiment, a researcher would track:

1. Drop-off Points: Where do users exit? (e.g., if they leave at the Login screen, the friction is too high).
2. Interaction Frequency: How many times do they click "Similar Items" before adding to the cart?

3. Rating Score: The final star rating provides the qualitative data to match the quantitative flow data.

4. Conclusion & Expected Outcome

If the experiment is successful, the data should show a "linear progression" with minimal backtracking. The presence of the "Go Back To Home" button on the final screen suggests a Retention Loop, inviting the subject to restart the experiment (shopping cycle) immediately.
